

[MICAC25] Minutes Week 4

Giovanni Menon Raphael Toubol Nyandoro Christopher

7th of April - 13th April 2025

Abstract

This document provides a summary of the two meetings that have been held during the fifth week.

Summary

First Meeting

For this weeks first meeting we went over the tasks on our trello board, noting the tasks complete and doing a summary of the PR's approved, making sure everyone understood what code was pushed to dev, what was changed and what tasks are still remaining on the open branches.

We also discussed refactoring a couple of elements already pushed to dev, and divided tasks for the week.

Items Discussed:

1. **Error Strategy:** How we want to handle errors so across module and function we are all using the same pattern.
2. **CLI:** review of the CLI implementation.
3. **Fetching CVEs:** a decision was made on the best api to fetch cve's from.
4. **Api Route Identification:** how the route identification can be done and what we analysis we will do from those findings.

Second Meeting

In the second meeting we reviewed the API Route Identification implementation, the fetchCVE function and discussed using a config builder pattern instead of directly specifying the config when the user chooses to use a single feature in the cli and not the entire suite.

The majority of this meeting was spent resolving merge conflicts into the dev branch as multiple people had done work on the same areas
